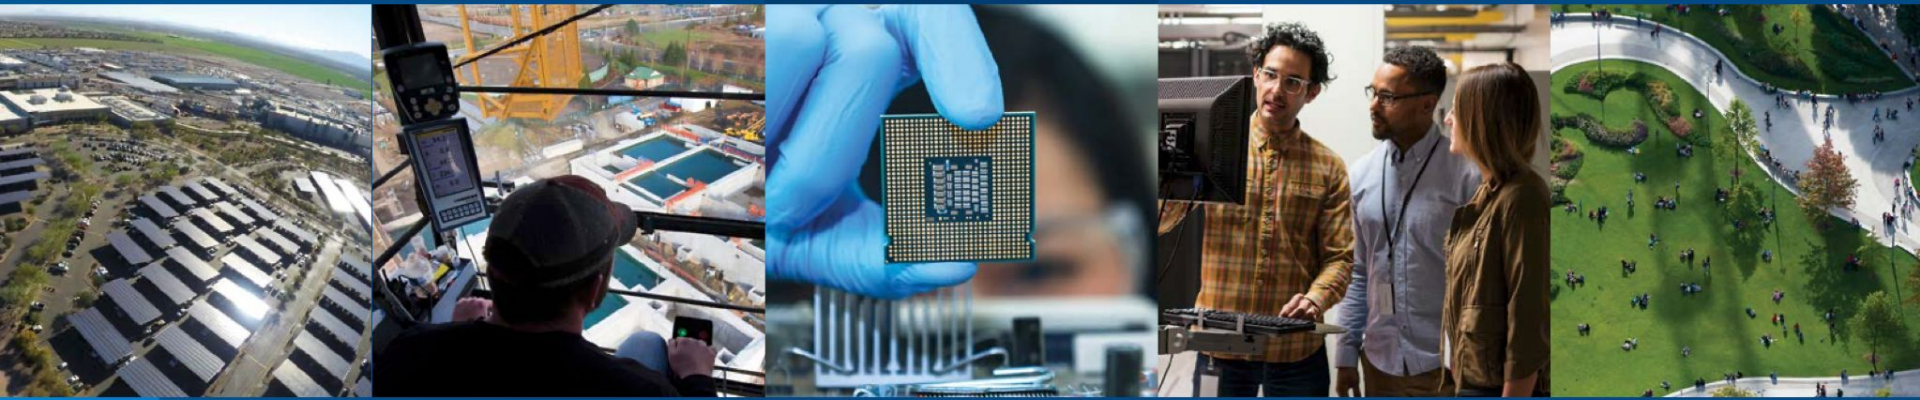
Intel’s Corporate Responsibility Report

[Samantha Smith]
[02/15/2026]



Intel Turns Technology Into Community Power

Intel's workforce doesn't just build chips—they build communities. With 1 million volunteer hours and $81.5 million in giving, Intel employees are mobilizing resources at scale. But the real transformation comes through education: 1.5 million students reached with STEM programs and 370 social-impact projects across 42 countries show technology as a bridge to opportunity, not just profit.

If Intel's operations were a city, it would be like powering 99 out of every 100 buildings with wind and solar—only 1 building still using fossil fuels."

Intel Builds Responsibility Into Every Link

Sustainability isn't something Intel does alone—it's embedded across suppliers, partners, and the next generation of talent. From reducing supplier emissions to converting interns into full-time diverse talent, Intel proves that responsibility scales when it's built into the entire value chain.

Intel cut emissions equivalent to taking 150,000 cars off the road permanently—while still growing the business.

Climate action + inclusion + safety—integrated across the entire

Intel Closes the Loop: 63% Waste Circularity

What happens to waste at Intel? It doesn't disappear—it transforms. Through reuse, recovery, and recycling, 63% of manufacturing waste stays in productive circulation. Only 6% reaches landfills. This circular approach proves that high-tech manufacturing can operate like nature: nothing wasted, everything repurposed.

Zero-Waste-to-Landfill Goal by 2030

"36 billion gallons saved since 2020 = enough to fill 54,545 Olympic swimming pools, or supply water to 330,000 U.S. homes for a year."

Intel Gives More Than It Takes: 110% Water Positive

Intel doesn't just conserve water—it returns more than it uses. Achieving net positive water status means for every gallon consumed in manufacturing, Intel restores 110% back to local communities through conservation projects and restoration efforts. It's not enough to do less harm; Intel is actively doing more good.

36 Billion Gallons Saved Since 2020

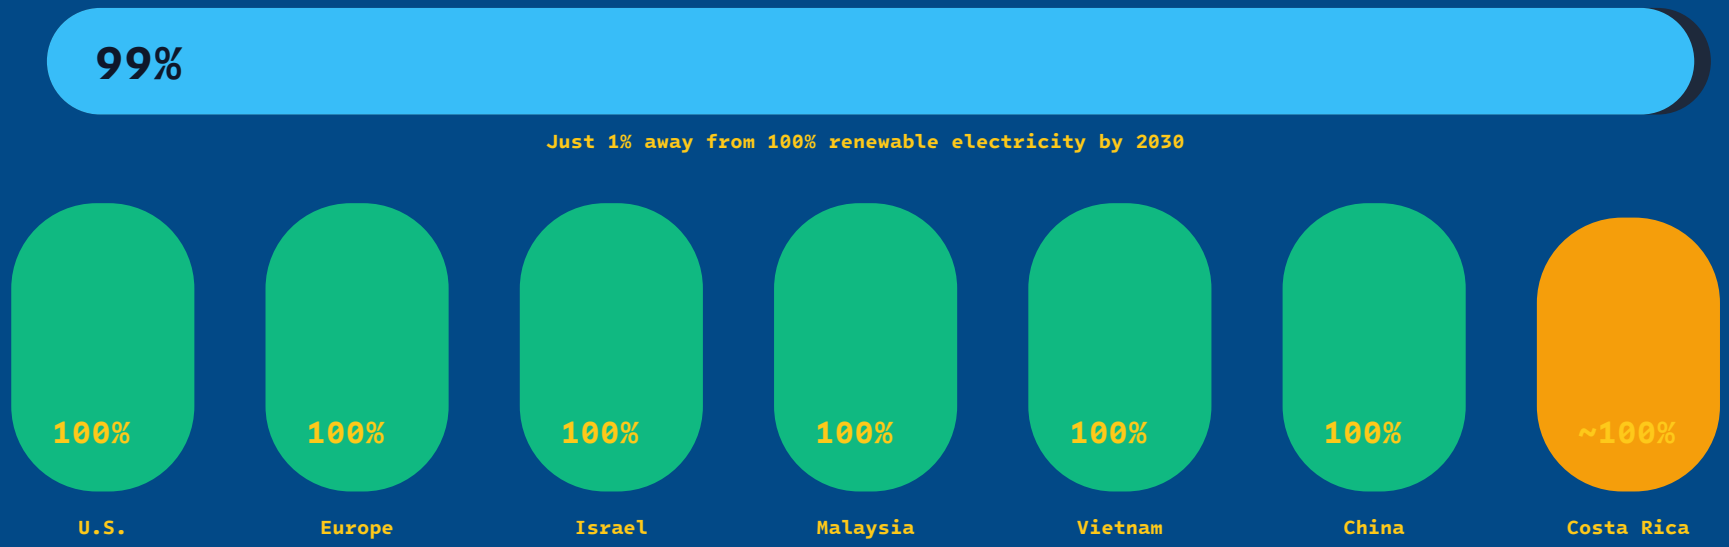
- It’s like borrowing $100 and paying back $110. Intel ‘borrows’ water for manufacturing, then ‘pays it back with interest’ to local ecosystems.

Intel Powers the Future: 99% Renewable

From data centers to chip factories, Intel has transformed its global energy footprint—achieving 100% renewable electricity across six continents. This isn't just an environmental milestone; it's proof that sustainable tech manufacturing at scale is possible today.

Intel's Global Renewable Electricity Progress



"If Intel's operations were a parking lot with 100 cars, 99 would be electric and only 1 would still run on gas."

Intel Shows Growth Can Be Green: 43% Emissions Reduction

While investing billions in R&D and expanding operations, Intel slashed greenhouse gas emissions by nearly half. This dramatic reduction—from 1.57 million to 0.89 million metric tons CO_2e—shows that innovation and sustainability aren't competing goals. They're the same mission.

If your monthly energy bill went from $157 to $89 while your lifestyle stayed the same, you'd say your home got much more efficient. That's what Intel did with its emissions.

43% Reduction • On Track for Net-Zero by 2040
